URL:http://www.dna.affrc.go.jp,
The orientation of the sequence is from T7 to SP6 of the PAC clone.
Genes were predicted from the integrated results of the
following:GENSCANI.O, BLASTNZ.O, BLASTNZ.O, as well as
SplicePredictor (October 1998 version). The genomic sequence was
searched against the non-redundant database NRP (PIK, SWISSPROT,
GENPEPT, PDB) from MAFF DNA bank and the cDNA sequence database at
RCP. Protein similarities of the cording regions were searched
against NRP with BLASTP2.O. ESTS represent the identified cDNA
sequences using BLASTN 2.O with the corresponding DDBJ accession
no. and RGP clone ID.

bin/display?db-wormaceGclass-Sequence &object=C50B6
Current sequence finishing criteria for the C. elegans genome
sequencing consortium are that all bases are either sequenced
unambiguously on both strands, or on a single strand with both a
dye primer and dye terminator reaction, from distinct subclones.
Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of
the specified clone. It may be shorter because we only sequence
overlapping sections once, or longer because we arrange for a small

Submitted (17-Aug-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, UGA

On Sep 20, 1999 this sequence version replaced gi:5748857.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a "working draft' sequence record is a robitrary. Gaps between the contigs are represented as * runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will

* be preserved.

on Sep 6, 1999 this sequence version replaced gi:5791529.
During sequence assembly date is compared from overlapping clones.
During sequence assembly date is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

EMBL; Sww. SWISSROT; Tr.; TREMBL; Wp:, WORNPEP; information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence is the entire insert of clone 112D6. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.

This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger centre chromosome 6 when the contract of bacterial clone and the bacterial clone and the bacterial clone contigs of the backer and the contract of bacterial clone contigs of the backer and the contract of the backer and the contract of the backer centre chromosome 6 when the contract of bacterial clone contigs of the backer and the contract of the backer centre chromosome 6 when the contract of the contract of backer centre chromosome 6 when the contract of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Patel, R.

bdgp@fruitfly.berkeley.edu. All contigs in this submission meet
        the following cutoffs: length >= 200 bases.
* NOTE: This is a 'working draft' sequence. It currently consists of 188 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SOURCE INFORMATION:
This clone is from a release of the human BAC library. The library contains cloned DNA from human sperm. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); Kim et al., Genomics 34:213-8 (1996). The clone is available from Research Genetics, linc. (http://www.resgen.com).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RG343P13;

* NOTE: This 1s a "working draft' sequence. It currently

* consists of 63 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NA HTG 03-AUG-1999

                                                                                                                              Bacillus furingiensis var israelansis cry D toxin gene and proteins used for producing insecticide compsns.active against Dipteran species. Claim 1; fig 12:58pp; English. cryb gene is inserted into plasmid and used to transform a microorganism. The 67kD protein encoded by the gene has insecticidal activity against dipteran larvae. Sequence 2100 Bp; 746 A; 316 C; 378 G; 660 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This fusion gene comprises sequences isolated from the PG14 strain of B.thuringiensis subsp. morrisoni. The cytA gene encodes a cytOlytic protein which has high affinity for the lipid portion of cell membranes. After ingestion by insects, the 27 kba Cyt A protein is cleaved by midgut proteases to a relatively resistant core of 25 kba. The Cyt A coding sequence is combined with the Cry toxin, also from B.thuringiensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 91.353775/48.

Extending host range or toxicity of insecticidal proteins - using protein capable of binding to gut epithelium of insects Claim 34; Fig 21: 61pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10-FEB-1992 (first entry)

Btm PG14 72kDa Cry insecticidal protein/25kDa Cyt A fusion gene.

chimeric; fusion protein; insecticide, Lepidoptera larvae;

midgut targetting; bacterial endotoxin; ss.

Bacillus thuringiensis subspecies morrisoni.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   879 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to: 2100

The cytA gene encodes a cytolytic protein which has high affinity for the lipid portion of cell membranes. After ingestion by insects, the 27 kDa Cyt A protein is cleaved by midgut proteases to a relatively resistant core of 25 kDa. The Cyt A coding sequence is combined with the Cry toxin, also from B.thuringlensis. 1023 A; 462 C; 503 G; 913 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                           Extending host range or toxicity of insecticidal proteins · using protein capable of binding to gut epithelium of insects Claim 33; Fig 22; 61pp; English.
10-FEB-1992 (first entry)

Btm PG14 72kDa Cry insecticidal protein/27kDa Cyt A fusion gene.

chimeric: fusion protein; insecticide: Lepidoptera larvae;

midgut targetting; Cry A; bacterial endotoxin; ss.

Bacillus thuringiensis subspecies morrisoni.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to: 2901

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis (Lim 1; Page 388-370; 1150pp; English.

X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DS-MAY-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fowl poxyirus-originated 5 kb DNA vector with hetrologous genes - useful as a vaccine, providing large copy number per cell, with superior preventive efficacy claim 2; page 36-39; Sapp; Japanese.

This sequence is used in the construction of a new vector originated from fowlpox virus which can duplicate poxyirus in infected cells. The part occurs of the poxyirus including orthopoxvirus and chicken poxyirus. The DNA vector is about 5 kb and is concomitant. It can grow in on-poxyirus-infective cells. It has a large copy number per cell, making the vaccine very effective.

memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
the Saureus DNA sequences allows putative functions to be assigned so
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
likely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against Saureus infection. The
colypeptides can also be used in a kit for the immunodetection of
Saureus in a sample. Saureus is implicated in numerous human diseases,
including cellulitis, eyelid infections, food poisoning, osteomyelitis,
skin and surgical wound infections, scalded skin syndrome, toxic shock
syndrome, etc. Organisms transformed with the DNA sequences can be used
for recombinant production of the polypeptides. The new DNA sequences
(and their fragments) are useful as primers or probes for isolating
computer readable medium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence encodes the Staphylococcus aureus gidB protein of the invention. GidB polymucleotides and polypeptides are useful for invention. GidB polymucleotides and polypeptides are useful for diagnosing susceptibility to diseases by detecting mutations or polymorphisms in the GidB gene or analysing for the presence of amount of gidB polypeptide expressed in a patient sample. GidB PCR probes are useful for diagnosing diseases, and can characterise the response of the infectious organism to drugs. GidB polypeptides and polymucleotides are also useful for screening for antagonists and antagonists are infectious micro-organisms. GidB agolists and antagonists are bacteriostatic and bacteriocidal compounds which can be used in treatment to enhance or block GidB activity, therefore treating diseases caused by microbial infection, especially S. aureus diseases including microbial infection, especially S. aureus diseases including costeomyelitis, septic arthritis, septic thrombophlebitis, acute bacterial endocarditis and bacteraemia in cancer patients. Epitopes of GidB colypeptides and polynucleotides are useful immunogens for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-MAY-1999 (first entry)

                                                                                          for
anti-GidB antibodies for prevention of bacterial infections, and GidB polynucleotides can be used in genetic immunisation to prevent infections. GidB polypeptides, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial infection. GidB polypeptides and polynucleotides may also be used as reagents for differential screening methods.

Polynucleotide(s) and proteins derived from Staphylococcus aureus retorated on computer readable medium and used in the production of auti-S.aureus vaccines

Pratics.aureus vaccines

This sequence represents one of 5191 Staphylococcus aureus DNA sequences

Cof the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access

Cof the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access

Cof the invention. The DNA sequences are recorded on a computer readable the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or the protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection of S.aureus in a sample. S.aureus in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the computer readable medium.

Computer readable medium.

Claim 2: Page 5-6; 43pp; English.

The present sequence encodes a partial gidal protein of Staphylococcus aureus. Gidal proteins, nucleic acids and agonists are used to treat conditions requiring increased activity or expression of gidal, while conditions (particularly bacterial infections) requiring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      25.MAR.1999 (first entry)
DNA encoding a partial gidAl protein.
GidAl: bacterial infection; meningitis; Helicobacter pylori infection;
cancer; ulcer; gastritis; antibacterial; in-dwelling device;
wound treatment; bacterial adhesion; matrix protein; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inhibition of gidal are treated by administering an antagonist, inhibitory nucleic acid or competitive polypeptide. The products are used to treat S. pneumoniae infection, particularly meningitis and gastritis. These antibacterial agents may also be used to treat in-dwalling devices to prevent infection or generally as wound treatments to prevent adhesion of bacteria to matrix proteins.                                                                                                                                                                                                                                                                                                                       Claim 1: Page 23; 29pp; English.

Equine dermal cells (NBL-6) were infected with EHV-4 strain 1942
Viral DNA, purified and a BamHI library constructed in pUC9.
Calcium shocked E. coli DHT cells were transformed with the
recombinant plasmids. Additional clones were derived from a
restriction digest of pUC9 contg. the BamHI G fragment. The
nucleocide sequence of a region of BamHI G fragment. Spanning the gC
gene was determined. by analysis of overlapping sequences (SEQ ID no
2). Vaccines can be prepd. using this sequence, and they may be used
to protect horses against EHV-4 infection, inducing a higher level

PP PPSDB; W89445.

PT New isolated gidAl polypeptide from Staphylococcus aureus - used to diagnose, treat and prevent bacterial infections e.g. S. aureus and PT H. Pylori and associated cancers, ulcers and gastritis

Claim 2; Page 3-4; 43pp; English.

CC The present sequence encodes a gidAl protein of Staphylococcus

CC aureus. GidAl proteins, nucleic acids and agonists are used to contitions requiring increased activity or expression of gidAl, while conditions requiring increased activity or expression of gidAl, while conditions requiring increased activity or expression of gidAl, while conditions requiring increased activity or expression of gidAl, confinibition of gidAl are treated by administering an antagonist, inhibition of gidAl are treated by administering an antagonist, consect to treat S. pneumoniae infection, particularly meningitis and class Helicobacter pylori infections e.g. related cancers, ulcers and cancer indeed to prevent infection or generally as wound creatments to prevent adhesion of bacteria to matrix proteins.

SQ Sequence 2132 BP; 791 A; 311 C; 430 G; 600 T;

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.edl.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila melanogaster genome survey sequence SP6 end of BAC BACN02A09 of DrosBAC library from Drosophila melanogaster (fruit fly), genomic survey sequence.

//clone=lib-"CuGI Rice BAC Library"
//clone=library road composition or rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a happioid genome equivalent of 431 Mbp (Arumyanathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library from Oryza sativa, Nipponbare variety. The library contains $6.864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents.

The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; euphyllophytes; Spermatophyta; Magnoliophyta; Liliopsida; Poales;
                                                                                                                                              Poeceae: Oryza.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial Ecord digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.
